Authentication

The interface allows creating **multiple API keys (tokens)** to give secure access to several partners; each key may access only selected components.

Where to find the API key (token)

A user with SUPER rights finds the key as follows:

1. Open the employee card the key was created for (e.g. XML)

2. Go to the `Admin` tab

3. Go to the XML `interfaces` section
4. On the relevant interface row, click 

to reveal the key

Usage

The token is sent via POST in the variable `token` (form/urlencoded). It replaces the legacy `appkey` + database name.

Errors

- Invalid/missing token: `<result type=„5“ desc=„Unauthorized“/>`
- Variable `token` missing: `<err>token required</err>`

The token is a secret equivalent to a password – never put it in URLs, logs or version control.
